

Nite Guard Solar® is based on scientific research. A flash of light implies to all animals that hunt or feed at night that they have been "discovered" or are being watched. This is their deepest fear and forces them to flee the area. A simple, but effective concept.

Use the Nite Guard Solar to PROTECT:

POULTRY and LIVESTOCK against coyote, fox, bear, mountain lion, wolf, bobcat, owls, hawk, mink, weasel, and skunk

GARDENS (flowers, sweet corn), ORCHARDS, VINEYARDS against deer and raccoon

BIRD FEEDERS, PURPLE MARTIN HOUSES, FISH PONDS against raccoon, hawk, owl, blue heron and bear

CAMPSITES, CABINS, and PROPERTY against bear, raccoon, mountain lion and even human intruders

To protect in all four directions, four lights are recommended.

Install lights at the eye level of the animal being repelled.

Maintenance Free: Solar-powered, no batteries needed. Automatically turns on at dusk and off at full daylight. This weatherproof unit will last approximately 3 years with continual use.

Environmentally Safe: Sprays, powders, fences, dogs or traps are no longer needed. Nite Guard will not harm the predator, simply repel.

Detailed instructions and warranty information inside.

NITE GUARD

Solar
Guards Against Night Time Intruders

PROTECT:
Campsites
Gardens
Poultry
Livestock
and more

The most primitive fear
night animals have is that of
being watched

Guaranteed to Stop: Raccoon, Owl, Fox, Coyote, Opossum, Cougar, Bear, Wild Bear, Mink, Skunk, Mt. Lion, Beaver, Blue Heron, Deer, Hawks & Intruders

Thank You for purchasing the Nite Guard Solar®

Solar powered Nite Guard Solar® uses sunlight or daylight to charge. No batteries are ever needed. It will continue to activate during long periods of cloudiness. The powerful flash of red light produced from this LED system will automatically activate at dusk and will force all night animals to flee the area.

This specially engineered flash implies to night animals that they are being watched or have been discovered by another predator or human and this is their deepest most primitive fear.

CHARGING INSTRUCTIONS:

Remove the protective tape covering solar panel, then position per mounting instructions. It begins to flash the first night and will continue to activate each night using a light sensitive photo cell.

POSITIONING:

Predators are determined to get at your poultry, livestock or crops and will circle the entire area searching for a safe entry. They must see the flash to be repelled; therefore the correct positioning of the light is critical. You are the best judge of the final positioning of your lights because each area is different in terms of terrain, buildings, grass, brush, and trees.

Mount the lights at eye level of the animal to be stopped and face it **away** from the area to be protected. One to four lights will be required depending upon your application. It is **NOT** motion activated but will flash automatically from dusk through dawn so night animals are stopped at long distances (500 yards or more) away. They do not come in to investigate but see the flash as a threat the instant they are aware of it. Protecting **ALL** directions will eliminate the night animals from finding an alternate entry point.

EXAMPLE: An animal located 1/4 mile away from Nite Guard Solar® will have a line of vision that covers 200 feet across.

MAINTENANCE FREE:

Nite Guard Solar® is completely weatherproof and will continue to function for years under extreme weather conditions. Blistering heat, below zero temperatures, rain, ice, snow and blowing dust/grime will not compromise the nightly function of this product.

MOUNTING INSTRUCTIONS

The quantity of lights to use and their positioning is determined both by your area and the predator you want to deter. Below are guidelines to help you determine what will best suit your predator problem. The instructions do assume open, flat ground. If the area to be protected is located on a hill, adjust the height of the lights lower. If the area is located on lower ground, like a valley, adjust the height of the light to be higher. Also consider the surrounding area – if your area is flat and open then the lights will be able to be seen from a greater distance and can be placed further apart.

1 OWLS and HAWKS

Four lights mounted 10-14 feet in the air on a single post with each light facing a different direction (*cluster mount*). For use with purple martin houses mount the lights directly to the house itself or one foot above the house on the same post or put the lights on a separate post and place the post nearby the house. For use with guineas you may need to place the lights higher than 14 feet; put the lights at the same level as the guineas are roosting.

A cluster mount is where four lights are secured to one post. A perimeter mount is where the lights are placed around all sides of an area.

2 SMALL GROUND PREDATORS

Predators like raccoon, opossum and skunk; put lights approximately 25-50 feet apart, around all four sides (*perimeter mount*) and eye level to the predator approximately 10-15 inches off the ground.

3 LARGE GROUND PREDATORS

Predators like fox, coyote, bobcat, wild boar, mountain lion and bear; put the lights approximately 100-200 feet apart, around all four sides (*perimeter mount*) and eye level to the predator approximately 20-30 inches off the ground. Use *cluster mount* for large, open acreage.

4 DEER

Four lights mounted 4 feet high on a single post with each light facing a different direction (*cluster mount*). Place the post in the center of the area to be protected. Unlike other night animals deer get used to seeing something in the same location so it is best to relocate the cluster mount about every 1-2 weeks to break the pattern.

DISCLAIMER: Nite Guard, LLC cannot be responsible for damage or injury that may occur as a result of the improper use of Nite Guard Solar® or the unpredictability of wild animals.
